FIG. 36 is a perspective view of the device 18 in a closed position. The device 18 includes a handle 104' and a head 104. The handle 104' is connected to the head 104 by a hinge 102. The head 104 includes a front face 106 and a back face 108. The front face 106 is defined by a front edge 110 and a front surface 112. The back face 108 is defined by a back edge 114 and a back surface 116. The device 18 is shown in a closed position, where the front face 106 is facing the back face 108.

FIG. 39

FIG. 40 is a perspective view of the device 18 in a retracted position. The device 18 includes a handle 18a and a shaft 18b. The handle 18a is connected to the shaft 18b by a joint 18c. The joint 18c is configured to allow the handle 18a to rotate relative to the shaft 18b. The handle 18a is further configured to be moved between a first position and a second position. The shaft 18b is configured to be inserted into a body 18d. The body 18d is configured to receive the shaft 18b and to move the shaft 18b between a first position and a second position. The body 18d is further configured to be moved between a first position and a second position. The body 18d is further configured to be moved between a first position and a second position.

FIG. 44

FIG. 45 is a perspective view of the device in accordance with the present invention, showing the device in a closed position. The device includes a handle 602, a body 604, and a head 606. The handle 602 is connected to the body 604 by a hinge 608. The head 606 is connected to the body 604 by a hinge 610. The device is shown in a closed position, with the handle 602 and the head 606 both pointing towards the body 604. The device is shown in a perspective view, with the handle 602 and the head 606 both pointing towards the body 604. The device is shown in a perspective view, with the handle 602 and the head 606 both pointing towards the body 604.
